

KAGU WEB STUDIO

SCOPE OF WORK · PHASE 1 · V1.0

WHAT WE ARE BUILDING. **EXACTLY.**

Foundations, padel reservation, the full cafe system and stock management. This document defines what is included, what is excluded, what Touch must provide, and the conditions under which the phase is accepted.

CONTENTS & DOCUMENT CONTROL

This document supersedes the scope described in the proposal for Phase 1 only.
Where the two disagree, this document governs.

SUMMARY

01	Scope at a glance	In, out, and what gets delivered	03
02	Architecture & stack	Fixed technology choices for this phase	04

MODULES

03	Foundations	Accounts, roles, bilingual RTL, platform	05
04	Padel reservation	Guest booking, desk calendar, rates, integrity	06
05	Cafe — guest side	Menu, table binding, ordering and waiter call — on the web	07
06	Cashier & dispatch	Till, kitchen screen, tabs, day close	08
07	Stock & recipes	Recipes, consumption, expiry by batch, counts, variance, margin	09
08	The website	The platform module 3 runs on, and the public face of the venue	10
09	Degraded mode	Single-writer fallback and local queue when the connection drops	11

CONDITIONS & DELIVERY

10	Operating in Iraq	Tax, currency and connectivity decisions	12
11	What Touch must provide	Client-side inputs, when they are needed, and the cost of delay	13
12	Delivery plan	Four parallel build tracks, then the review and handover window	14
13	Acceptance, change & terms	Sign-off conditions, change control, commercials	16
14	Agreement	Signature page	17

DOCUMENT CONTROL

Version	1.0 — for signature
Supplier	Kagu Web Studio
Client	Touch Padel, Iraq
Approver	Mustafa
Start	On receipt of the down payment
Build	4 weeks from start
Review & handover	2 further weeks

HOW TO READ THIS

Each module lists what is **included** and what is **not included**. If a capability is not written in this document, it is not in Phase 1 — regardless of whether it appeared in the proposal, in a conversation, or in a screen mock-up.

That is not a way of narrowing the work. It is how both sides can tell, on the final day, whether the phase is finished.

SCOPE AT A GLANCE

The whole phase on one page. Detail follows in the module sections.

IN SCOPE - PHASE 1

- Accounts, email authentication, roles and permissions
- Bilingual English / Arabic with full right-to-left
- Padel court reservation in the mobile app and at the desk
- Cafe menu, QR table binding, ordering and waiter call — **on the web, no app install**
- Cashier and payment at the desk, tabs, splits, discounts
- Kitchen display screen for preparation dispatch
- Charge a cafe order to a court booking
- Recipe-level stock with consumption, expiry tracking, counts and variance
- Degraded mode — the till keeps trading and queues locally through an outage
- Public website carrying the whole cafe guest experience
- Deployment, store publishing, and handover documentation

OUT OF SCOPE - LATER PHASES

- Online and in-app payment — **desk payment only**
- Coaching, courses, coach schedules and commission settlement
- Open matches and seat splitting
- Tournaments and leagues
- Touch Shop retail and pro-shop inventory
- Loyalty points, rewards and tiers
- The management analytics panel and Customer 360
- PostHog behavioural analytics instrumentation
- Offline operation — the system requires a connection to trade
- Purchase orders and supplier management
- Multi-venue and multi-location stock

APPLICATIONS	LANGUAGES	PAYMENT	VENUE
Mobile · Desktop · Web	English & Arabic, RTL	At the desk only	1 till · 1 prep station

DELIVERABLES

DELIVERABLE	FORM	DELIVERED TO
Guest mobile app	iOS and Android builds via Expo EAS — padel booking only	Published by Kagu under Kagu's developer accounts
Operator desktop app	Windows installer — Electron or Tauri wrapper	Installed on the till and desk machines
Public website	Next.js on Vercel — carries the cafe guest experience	Touch's domain
Backend	Supabase project — database, auth, storage	Owned by Touch, administered by Touch
Source code	Git repositories	Touch's account, transferred at acceptance
Documentation	Runbook and staff guide, English and Arabic	Written, plus recorded training

02

ARCHITECTURE & STACK

Fixed for this phase. Any change to this list is a change request.

COMPONENT	TECHNOLOGY	NOTES
Guest mobile app	React Native + Expo	One codebase for iOS and Android, built and submitted through Expo EAS. Padel booking only — no cafe section. Over-the-air updates for copy and non-native fixes.
Push notifications	Expo Push	Booking confirmation, reminder and cancellation. Cafe order status is shown live on the web page instead.
Operator desktop app	Electron or Tauri	Windows only. A wrapper around the same web application, installed on the till and desk machines so it opens on boot and cannot be closed as a browser tab. The wrapper is confirmed in week 1 against thermal-printer support; the application inside it is identical either way.
Public website	Next.js	Server-rendered on Vercel. Carries the whole cafe guest experience — menu, table binding, ordering, waiter call — from the same records as the desktop app.
Database & auth	Supabase - Postgres	Single source of truth for all three clients. Row-level security enforces roles at the database, not in the interface.
Realtime	Supabase Realtime	Pushes new tickets to the kitchen screen, order status to the guest's page, and released courts back onto the booking grid, without polling.
Language	TypeScript throughout	Database types generated from the schema, so a column change breaks the build rather than a shift.

ONE APPLICATION, ROLE-BASED VIEWS

The desktop app is a single build. What a user sees is decided by their role, not by which program they opened — a cashier gets the till, a manager on the same machine also gets the desk and stock views. One codebase, one deployment, one place to change a permission.

ROLES DELIVERED IN THIS PHASE

Cashier	Till, orders, table service
Prep	Kitchen display only
Court desk	Reservation calendar, walk-in bookings
Manager	All of the above, plus stock, menu, rates, day close and discounts
Owner	All of the above, plus staff and role administration

WHY THE CAFE LIVES ON THE WEB AND NOT IN THE APP

A guest at a table will not install an application to order a coffee, and requiring one is the largest cause of failure in QR ordering. Scanning the table code with the phone's own camera opens the menu in the browser, already bound to that table, with nothing to install and no account to create. The app is reserved for padel, where a guest has reason to return and hold an account.

NOT INCLUDED IN THE STACK

RevenueCat is **not** used. It handles App Store and Play subscriptions, and both stores prohibit in-app purchase for real-world goods and services — court time and food are paid for outside the app. Phase 1 is desk payment only, so no payment SDK of any kind is integrated. Recorded here so it is not mistaken for an omission.

MODULE 1 FOUNDATIONS

Everything the other four modules stand on. Built first, and the reason the phase is sequenced the way it is.

INCLUDED

ACCOUNTS & AUTHENTICATION

- Guest sign-up and sign-in by **email and password**, with email verification and password reset
- Guest profile: name, phone number, preferred language
- Staff accounts created and managed by the owner role
- Session handling across mobile, desktop and web, with anonymous table sessions on the cafe site
- Short-lived sessions on shared till machines, with a PIN for sensitive actions

ROLES & PERMISSIONS

- The five roles listed in the architecture section
- Permissions enforced by row-level security in the database
- An append-only audit log recording actor, action, before and after values, and a reason code on discounts, voids, price overrides, stock adjustments and reservation overrides

BILINGUAL & RIGHT-TO-LEFT

- English and Arabic across all three clients
- Full RTL layout using logical properties, not a mirrored stylesheet
- Bidirectional text handling for Latin fragments inside Arabic strings
- Numeral system, date, time and currency formatting per locale
- Menu items, court names, categories and notifications stored in both languages in a single record, edited side by side in the desktop app
- Fallback to the other language where a translation is missing

PLATFORM & DELIVERY

- Supabase project, schema, migrations and generated types
- Staging and production environments
- Deployment pipeline for all three clients
- Error tracking and uptime monitoring on the booking and ordering paths
- Automated daily backups with point-in-time recovery

NOT INCLUDED

- Phone / SMS one-time-code login
- Social or Apple / Google sign-in
- Household or family account linking
- Customer-facing profile history beyond their own bookings and orders
- Any third language
- Staff shift scheduling or time clock

WHY EMAIL AND NOT PHONE

Phone one-time codes cost money per message and need a regional SMS provider contracted before launch. Email removes that dependency and that cost from Phase 1 entirely. Phone-based identity can be added later without a data migration, because the phone number is captured on the profile from day one.

ACCEPTANCE

A guest can register, verify, sign in and change language on all three clients with layout correctly mirrored. Each of the five roles sees only what its permission set allows, confirmed by a written role test.

MODULE 2 PADEL RESERVATION

Court hire, guest side and desk side, on one calendar.

INCLUDED

GUEST BOOKING, MOBILE APP

- Day view of live availability per court, with the price for that specific slot
- Court records: name, indoor or outdoor, description, photograph
- Duration options configured per court
- A short exclusive hold on the slot while the guest completes booking, expiring automatically and returning the slot to the grid
- Booking confirmation, with the reservation visible in the guest's account
- Guest-initiated cancellation, subject to the configured policy
- Push notifications for confirmation, reminder and cancellation

DESK AND CALENDAR, DESKTOP APP

- Day and week calendar across all courts
- Create a booking for a walk-in, with or without a linked guest account
- Move, shorten, extend and cancel a reservation
- Block court time for maintenance or a private event
- Mark a booking as arrived, completed or no-show
- Every override written to the audit log with actor and reason

RULES & PRICING

- Rate rules by weekday, time window and court, with peak and off-peak
- Each booking stores the rule that produced its price, so a historical figure can always be explained
- Configurable cancellation window and no-show handling
- Opening hours and closed days

DOUBLE-BOOKING PREVENTION

All court time — guest bookings, desk bookings, holds and maintenance blocks — is written to a single reservation table protected by a database exclusion constraint on court and time range. Two overlapping reservations cannot be stored, so an overlap is not a bug to be caught in code but a write that fails. Delivered with concurrency tests that fire simultaneous requests at one slot and assert that exactly one succeeds.

NOT INCLUDED

- Payment at the time of booking — guests reserve, then pay at the desk
- Open matches, seat claiming and cost splitting between players
- Player levels and matchmaking
- Tournaments, leagues and fixtures
- Coaching and lesson booking of any kind
- Memberships, subscriptions and member rates
- Recurring or block bookings
- Waiting lists

ACCEPTANCE

A guest books a court from the app and it appears immediately on the desk calendar. Staff create, move and cancel bookings. The concurrency test suite passes. Touch has taken real bookings on the system.

MODULE 3 CAFE — GUEST SIDE

The menu, the table it is bound to, and how a guest gets a member of staff. All of it on the web, with nothing to install and no account to create.

INCLUDED

MENU

- Categories and items with photograph, description, price and availability
- Sizes and variants, each with its own price
- Modifiers and options with price differences — milk type, extra shot, sides
- Allergen and dietary flags
- Add-on suggestions attached to an item as it is added to the basket
- Item marked unavailable by staff, restoring automatically the next day
- Items greyed out automatically when a required ingredient is out of stock
- All content bilingual, edited once in the desktop app and live everywhere

TABLE BINDING

- Printed QR code per table, scanned with the phone's **native camera** — no app, no scanner, no install
- The code carries a **signed table token**, not a plain table number, so the binding cannot be forged by editing a web address
- The page opens already bound to that table, in the guest's device language
- Tokens are rotatable per table, so a photographed code can be retired
- Binding expires after a configured period of inactivity
- Print-ready QR artwork supplied for every table, in Touch's branding

ORDERING & WAITER CALL

- Basket, review and send to the bound table
- **Ordering is anonymous by default** — no sign-up required. Signing in is optional and attaches the order to an existing account
- Live order status on the page while it is open, updating as the kitchen works: sent, being prepared, ready
- One-tap waiter call with a reason — order, bill, water, assistance
- Calls rate-limited per table, moving through raised, acknowledged and resolved, each stamped with who acted and when
- Full bilingual English and Arabic with right-to-left layout

NOT INCLUDED

- **Any cafe functionality in the mobile app** — the app carries padel only and has no cafe section
- Paying for the order on the web — the bill is settled at the desk
- Web push notifications when an order is ready — status is shown live on the open page
- An account requirement, tipping, or loyalty points on cafe spend
- Delivery, collection or ordering from outside the venue
- Scheduled or pre-orders, and guest-to-guest bill splitting
- Behavioural analytics on menu views and suggestion take-up

ORDERING IS NOT PAYING

An order placed from a phone opens a tab against the table. It is prepared and served exactly like a counter order and settled at the desk before the guest leaves. This is the single most important thing for staff to understand at launch and is covered explicitly in training.

ACCEPTANCE

A guest with no app and no account scans a table code, orders in either language, the ticket reaches the kitchen screen, the status updates on their page, the waiter call reaches the floor view, and the tab settles correctly at the till.

MODULE 4 CASHIER & DISPATCH

The till, and the screen the kitchen works from. One till station and one preparation station in this phase.

INCLUDED

CASHIER

- Category and item grid built for speed, keyboard-first with touch supported
- Open tabs by table, by court or by name
- Add items with modifiers and sizes; edit a tab before sending
- Merge tables; split a bill by item or evenly
- **Charge a cafe order to a court booking** so a group settles courts and drinks in one payment
- Payment recorded at the desk — cash and card, with the card terminal operating independently of this system
- Change calculation and a cash drawer opening record
- Discounts and price overrides behind an authorised PIN with a reason code
- Voids after a ticket has been sent recorded as waste, not deleted
- Refunds by a manager role, reversing the stock movement
- Configurable tax rate per item group, applied and shown on the bill
- Printed or on-screen bill for the guest

KITCHEN DISPLAY

- Live ticket list with age, items, modifiers, and table or court number
- Colour change as a ticket passes its target time
- Mark item ready and ticket complete, notifying the floor and the guest
- Actual preparation time stored per ticket
- Tickets from the guest app and the till appear in one list, in arrival order, tagged with where they came from

SHIFT & DAY CLOSE

- Opening float, cash counted at close, expected against counted with the variance stated
- Card total for reconciliation against the terminal batch
- Summary of discounts, voids, refunds and waste with the authoriser named
- Day cannot be closed while a tab is still open on the floor

NOT INCLUDED

- Integration with a card terminal — the terminal is operated separately and its total is entered at close
- Integrated or automated cash drawer hardware control
- Printed kitchen tickets — the kitchen works from the screen
- A second till or second preparation station
- Staff performance reporting
- Accounting system integration
- Fiscal or government-registered receipt devices — see section 10

RECEIPT PRINTING

A thermal receipt printer is supported for the guest bill. Where the bill language is Arabic it is composed and sent as a rendered image rather than as characters, because low-cost thermal printers cannot shape Arabic from their built-in character sets. Touch supplies the printer against the specification we issue.

ACCEPTANCE

A full trading day is completed on the system and the day close reconciles cash and card against the terminal batch, with every discount, void and refund traceable to a named actor.

MODULE 5 STOCK & RECIPES

Recipe-level consumption, one location. Stock falls as orders are made, not at month end.

INCLUDED

INGREDIENTS & RECIPES

- Ingredient records with unit, pack size, cost and supplier
- A bill of materials per product — quantities per ingredient
- **Usable yield** percentage per ingredient
- **Waste allowance** per unit, held separately from recorded waste
- Sub-recipes: a syrup or sauce batch produced once and consumed by many products
- Modifier-aware consumption — oat milk deducts oat milk, a double shot deducts twice the coffee
- Per-size quantities, not a multiplier

STOCK LEDGER

- Stock held as an append-only ledger of movements, never an editable number
- Goods received against a delivery, with short-delivery capture and an **expiry date per received batch**
- Automatic deduction from the recipe when an order is confirmed
- Waste recorded by staff with a reason: spill, spoilage, void after send
- Adjustment only as the result of a physical count

EXPIRY & SHELF LIFE

- Shelf life per ingredient; expiry captured or calculated at goods-in
- Stock tracked **by batch**, so one ingredient can be held with several expiry dates at once
- Consumption deducts **first-expiring first**, matching how a kitchen actually works rather than assuming one undifferentiated pile
- Expiring-soon report with a configurable window, and an expired list
- Expired stock written off with its own reason code, separated from spillage and spoilage in the variance report

COUNTS, VARIANCE & COST

- Physical count entry per ingredient
- **Variance report** — theoretical against counted, by ingredient and period, with the movements behind it one click away
- Cost of goods and gross margin per menu item, moving with supplier cost
- Low-stock and par-level alerts; menu items greyed out when an ingredient runs out

NOT INCLUDED

- Purchase orders and supplier ordering workflow — goods received only
- Supplier price history and cost drift reporting
- Suggested order quantities
- Transfers between locations — one location in this phase
- Retail or pro-shop stock
- Automated reordering
- Supplier lot numbers and recall tracing — expiry is tracked per received batch, not per manufacturer lot

THE DEPENDENCY THAT DECIDES WHETHER THIS WORKS

Stock accuracy is capped by recipe accuracy. If quantities are estimated rather than measured, the variance report will show noise and staff will stop trusting it within a month. Touch supplies measured recipes against the template we issue in week one. This is the single largest client-side input in the phase and the most common cause of delay.

ACCEPTANCE

A physical count is run against a period of trading and the variance report reconciles to Touch's satisfaction, with every movement traceable to the order, delivery or waste entry that caused it.

MODULE 6 THE WEBSITE

The Next.js platform that module 3 runs on, plus the public face of the venue. Built once, serving every cafe guest who scans a table code.

INCLUDED

PLATFORM

- Next.js application deployed on Vercel to Touch's own domain
- Server-rendered, reading the same Supabase records as the desktop app — one menu, one place to edit it, live within seconds of a change at the till
- Bilingual English and Arabic with locale routing and full right-to-left
- Mobile-first throughout — effectively every visitor arrives from a phone camera
- Installable to the home screen, so a regular can return without scanning
- Performance budget suited to a venue connection, with images optimised and served at device size
- Touch branding, applied from the assets supplied in week 1

PUBLIC PAGES

- The cafe menu and ordering experience described in module 3
- Venue information: address, opening hours, contact and map link
- Search-engine metadata, page titles, descriptions and social preview images
- A link through to the mobile app for padel booking, on both stores

DELIVERY

- Preview deployment per change, so Touch can review before anything goes live
- Custom domain, TLS and DNS configuration
- Error tracking on the ordering path

NOT INCLUDED

- Court booking from the website — booking lives in the mobile app and at the desk
- A wider marketing site — about pages, galleries, blog, contact forms, events listings
- Guest account management on the web beyond optional sign-in at checkout
- A content management system beyond what the desktop app already edits
- Analytics, marketing tags or advertising pixels
- Copywriting, photography and translation — supplied by Touch

ONE SURFACE, TWO AUDIENCES

The same site serves the guest at table nine who wants a flat white and the stranger who searched for the venue last night. The first arrives with a table token and sees ordering; the second sees the menu and the venue details. There is no second site to build or keep in step.

ACCEPTANCE

The site is live on Touch's domain in both languages, matches the desktop app exactly, reflects an availability change made at the till without a redeploy, and completes an order end to end from a scanned table code.

MODULE 7 DEGRADED MODE

What happens when the venue loses its connection: while the desk cannot reach the server, the desk is the only thing allowed to write.

WHY A SINGLE WRITER, RATHER THAN SYNCING EVERYONE

A cafe order is an append-only fact — two never contend, and replaying them is safe. **A court booking is not.** If the desk sells court 3 at 19:00 offline while the app sells the same slot, both guests have been told they have it, and no merge rule invented afterwards makes that true. Rather than detect such conflicts and telephone a customer to cancel, the system removes the possibility: during an outage only one channel writes.

INCLUDED

DETECTION

- The desktop app sends a heartbeat to the server on a short interval
- When it stops, the venue is marked **degraded** and guest writes are refused server-side — not hidden in the interface
- Normal operation resumes on the first successful heartbeat; every degraded period is logged with its start, end and duration

WHAT EACH CLIENT DOES

- **Desktop app** — keeps trading from cached reference data: menu, prices, recipes, courts, tables and today's reservations. Writes go to a durable local queue
- **Kitchen display** — continues from that same queue, so food still reaches the pass
- **Mobile app** — browsing and existing bookings stay visible; **new bookings inside the protected horizon are blocked**, with a clear message and the venue's phone number
- **Cafe website** — menu stays readable; ordering and waiter call are blocked, directing the guest to a member of staff

THE QUEUE

- Every write flushed to disk **before** the screen confirms it, so a power cut cannot lose a confirmed ticket
- Device-prefixed identifiers and an idempotency key per write, so two stations cannot collide and a replay cannot double-charge
- Replayed in order on reconnect with server-assigned timestamps; stock settles server-side, and anything driven negative is raised to the manager
- A banner states the mode and the queued count, and the day cannot be closed while unsynced items remain

THE PROTECTED HORIZON

Blocking every guest booking during an outage would stop a member booking next Saturday from home because a router failed at the venue. The lockout covers only what the desk could plausibly sell offline — today and tomorrow, configurable. Bookings beyond it continue normally.

NOT INCLUDED

- Full offline operation from a local on-premises database — a later phase
- Offline use of the mobile app or website; both need a connection
- Automatic conflict merging — see below

THE ONE HONEST LIMIT

There is a short window between the desk losing its connection and the server noticing. A booking made in those seconds can still collide with one taken offline; the database constraint catches it on replay and shows the desk a conflict rather than an overwrite. A short heartbeat keeps that window to seconds — not to zero, and it is not claimed to be.

ACCEPTANCE

With the network disconnected the till keeps taking orders and the kitchen screen keeps receiving them; app and website refuse near-term writes; and on reconnect every queued item appears exactly once, with stock and totals reconciling.

OPERATING IN IRAQ

Three local conditions that change what the software has to do. Recorded here so they are decided now rather than discovered during installation.

TAX - NO FISCAL DEVICE REQUIRED

Iraq does not operate a general VAT or sales tax system, and there is no requirement for a government-registered fiscal cash register or certified receipt device of the kind found in Turkey or the Gulf. A sales tax of 10% applies to services rendered by deluxe and first-class restaurants and hotels; whether Touch Cafe falls within that classification is a determination for Touch's accountant, not for Kagu.

What we build: a configurable tax rate held per item group, applied at the till, shown separately on the bill and reported at day close. Setting it to zero, to ten per cent, or to different rates by category is a configuration Touch controls. No fiscal device integration and no e-invoicing submission is in scope.

CURRENCY

The system holds one **trading currency**, configured at setup, in which all prices, bills, stock costs and reports are expressed.

Touch must confirm before build starts whether the venue prices in Iraqi dinar or in US dollars. If both are taken at the counter in practice, that is a dual-currency till — a second display currency, a fixed or editable daily rate, change given in the other currency, and both totals reconciled at day close.

Dual currency is not included in this scope and would be quoted as an addition.

CONNECTIVITY AND POWER

Iraq's power and connectivity conditions are the reason module 7 exists. **The till keeps trading through an outage**, queueing locally and syncing on reconnect, while the app and website are locked out of near-term writes so nothing can be sold twice.

Two things remain Touch's responsibility: a business internet connection wired to the till, and a **UPS on the till, its printer, the router and the switch**.

Most interruptions in practice are power rather than network, and a UPS costs little against the trading it protects. Full offline running from an on-premises database is a later phase.

LANGUAGE

The phase delivers English and Arabic. If the venue is in the Kurdistan Region and Kurdish is expected by guests or staff, that is a third locale and a change request — inexpensive once the framework exists, but it must be raised before content is written rather than after.

WHAT TOUCH MUST PROVIDE

Kagu works remotely. Everything below is client-side. The build is four weeks, so these land earlier than they would on a longer plan — a week's delay here is a week off the end.

ITEM	NEEDED BY	CONSEQUENCE IF LATE
Down payment	Before start	The four-week build begins on receipt, not before
Named approver available weekly	Throughout	Phase acceptance cannot be signed
Court list, hours, rates, cancellation policy	Week 1	Module 2 cannot be configured or tested
Trading currency and tax decision	Week 1	Till and reporting cannot be finalised
Branding assets — logo, colours, photography	Week 1	Interfaces ship in placeholder styling
Full menu with prices, sizes and modifiers	Week 1	Track C has nothing to render; the website slips
Domain registered, with DNS access	Week 1	The website cannot go live on Touch's domain
Supabase account funded in Touch's name	Week 1	Production cannot be provisioned; the system stays on development limits
English and Arabic copy for all content	Week 2	The Arabic build cannot be accepted
Table numbering and floor layout	Week 2	QR artwork cannot be issued
Measured recipes per product	Week 2	Module 5 cannot be delivered — the single largest risk in this phase
Ingredients — pack size, cost, supplier, shelf life	Week 2	Margin reporting and batch expiry are unusable
Staff list with intended roles	Week 3	Accounts cannot be created for training
Hardware in place — till, kitchen screen, printer, network	Week 3	Installation and testing cannot proceed
Staff available for training	Week 5	Handover is incomplete

COSTS BILLED TO TOUCH

Two services only. Paid by Touch directly, in Touch's name, and not included in the phase fee:

SERVICE	INDICATIVE
Supabase — database, auth, storage	from \$25/mo
Domain registration and renewal	annual

Nothing else is charged on. Every other service the system runs on is carried by Kagu, and no further billable service is adopted without Touch agreeing first.

CARRIED BY KAGU

Developer accounts, website hosting, the build service and error tracking are held and paid for by Kagu. Touch opens, funds and administers none of them.

Stated plainly: those accounts sit under Kagu. Should Touch wish to hold any directly, Kagu transfers it at no charge — Touch opens the account, and for the stores the timing is theirs, not ours.

STORE REVIEW

Apple and Google review submissions on their own timetable, typically a few days but occasionally longer, and a rejection resets the clock. Weeks 5 and 6 are held for exactly this. **The review outcome remains outside our control**, and acceptance of the mobile app is on submission of a working build, not on store approval.

DELIVERY PLAN

Four weeks of build, then two weeks held for store review, fixes, training and handover. The build runs as parallel tracks against a shared foundation, not as one queue.

BUILD 4 weeks	REVIEW & HANDOVER 2 weeks	TOTAL WINDOW 6 weeks	STARTS On down payment
------------------	------------------------------	-------------------------	---------------------------

BUILD - WEEKS 1 TO 4

TRACK	WEEK 1	WEEK 2	WEEK 3	WEEK 4
A · Platform & data	Schema, migrations, email auth, roles and row-level security, bilingual content model, environments and pipeline	Reservation model with its exclusion constraint and concurrency tests, menu and recipe schema, realtime channels	Audit log, tax configuration, day-close model, reporting queries, heartbeat and degraded-mode lockout	Backups and point-in-time recovery, monitoring, load test at twice peak
B · Mobile app padel	App shell, EAS pipeline, authentication screens, RTL foundation	Court browsing, live availability grid, slot holds	Booking end to end, push notifications, cancellation policy	Polish, store listing assets, submitted to both stores
C · Website cafe guest	Next.js shell, locale routing and RTL, deploy pipeline, domain and TLS	Menu rendering from live data, signed table-token binding	Basket, ordering, waiter call, live order status	Venue information, metadata, home-screen install, live on Touch's domain
D · Desktop till & desk	Wrapper and shell, role-based routing, staff sign-in	Desk calendar with create, move and cancel; menu and content editor	Cashier, tabs, splits, discounts, charge-to-booking, kitchen display, day close	Local cache and durable write queue with replay; stock — ingredients, recipes, goods-in with batch expiry, consumption, counts, variance

REVIEW & HANDOVER - WEEKS 5 AND 6

- **Store review.** Apple and Google assess the submission, typically within days. Two weeks are held so that one rejection and resubmission still lands inside the window
- Defect fixing against the acceptance tests in each module, including the disconnection drill for module 7
- Staff training by role, recorded in both languages
- Runbook and staff documentation delivered
- Restore rehearsal and repository handover
- Acceptance walkthrough and sign-off with Mustafa

WEEK 1 IS FOUNDATION-LED

Tracks B, C and D can build their shells immediately, but they cannot go deep until track A has landed the schema, the authentication model and the reservation table. Track A therefore runs a few days ahead throughout week 1. This is the one genuine sequencing constraint in the plan, and it is the reason the foundation is not something that can be moved later.

PRIORITY ORDER IF THE WINDOW TIGHTENS

A four-week build leaves no slack, and both sides should agree now what gives way first rather than deciding it in week four. In descending order of priority:

- 01 **Platform and padel reservation** — the phase has no value without these and they are not negotiable. They are also on the critical path for the store submission, which cannot slip without spending the review buffer
- 02 **Cashier and kitchen display** — the cafe cannot trade on the system without them
- 03 **Web ordering and waiter call** — the cafe can trade at the till while these follow, though the website itself carries the menu and must ship
- 04 **Degraded mode** — the heartbeat lockout is cheap and ships regardless, since it is what prevents a slot being sold twice. The desk-side cache and write queue is the larger half and can follow in the review weeks if it must
- 05 **Stock and recipes** — the largest module, last in the build and first to move. It will move if measured recipes have not arrived by the end of week 2
- 06 **Batch expiry tracking** — if stock must be reduced rather than deferred, expiry gives way first and recipe-level consumption stays intact

WHAT THE TWO-WEEK BUFFER IS FOR – AND WHAT IT IS NOT

It exists to absorb store review, including one rejection, and the defect fixing that follows a first real week of use. **It is not spare build time.** Spending it on late scope means there is nothing left to absorb a store rejection, and the mobile app is then the thing that slips.

Acceptance of the mobile app is on submission of a working build. Store approval timing is controlled by Apple and Google and sits outside Kagu's commitment.

WHAT WOULD EXTEND THE WINDOW

- A dependency in section 11 arriving after the week shown
- A change request accepted mid-phase
- Dual-currency handling at the till
- A third interface language
- More than one store rejection, or a review that runs beyond two weeks

WEEKLY RHYTHM

A working build is demonstrable at the end of every week, and a short review call with Mustafa closes each one. Four weeks is too short to discover a misunderstanding in week three; the weekly demonstration is how that is prevented.

ACCEPTANCE, CHANGE & TERMS

How the phase is signed off, how changes are handled, and what happens afterwards.

ACCEPTANCE

Each module carries its own acceptance test, stated in its section. The phase is accepted when all seven have been demonstrated to **Mustafa** and signed off in writing, and when:

- A guest can register and book a court in the mobile app, and order to a table from the website with no app and no account, in English and in Arabic
- Staff can run a full trading day and close it with cash and card reconciled
- A physical stock count produces a variance report that reconciles
- Every role sees only what its permission set allows
- The concurrency test suite passes on the booking path
- Staff can complete their daily procedures unaided after training
- Touch holds administrative ownership of every repository and account

Acceptance is not withheld for items listed as out of scope in this document, nor for matters outside Kagu's control such as store review timing. The mobile app is accepted on submission of a working build.

AFTER ACCEPTANCE

- **30-day warranty** on defects — behaviour that does not match this document is fixed at no charge
- New capability, including anything listed as out of scope, is a new phase
- Ongoing support and maintenance is optional and quoted separately

CHANGE CONTROL

Any request that adds to, removes from or alters what is written here is recorded in writing with its effect on the delivery date and the fee, and is either approved by Touch or deferred to a later phase before work on it begins. Nothing is absorbed silently, and nothing is refused out of hand.

COMMERCIAL TERMS

Fee	as agreed — see contract
Currency	US dollars
Down payment	Due before start; the four-week build begins on receipt
Balance	On written acceptance of the phase
Running costs	Supabase and the domain only, paid by Touch directly and not included — see section 11
Everything else	Hosting, build service, error tracking and store accounts are carried by Kagu
Hardware	Bought and installed locally by Touch against Kagu's written specification

OWNERSHIP

On acceptance and settlement, Touch owns the source code, the database and its migration history, all customer and transaction data, the domain and its Supabase project, together with the runbook and technical documentation. Hosting, the build service, error tracking and the store listings are held under Kagu's accounts and are transferable to Touch on request, as set out in section 11.

AGREEMENT

Signing below confirms that both parties have read this document and agree that it defines the whole of Phase 1.

WHAT IS BEING AGREED

- The seven modules described in sections 03 to 09 are delivered in full
- Everything listed as not included is excluded from this phase and from its fee
- Touch supplies the items in section 11 by the weeks shown
- Four weeks of build and two weeks for store review, fixes, training and handover, beginning on receipt of the down payment
- Payment is taken at the desk only; there is no online or in-app payment
- All cafe guest functionality is on the website; the mobile app carries padel only
- Touch pays for Supabase and the domain only; every other service is carried by Kagu
- The till keeps trading through an outage; full offline running from a local database is a later phase
- Changes follow the change-control process in section 13
